

## TechOut End to End Outlook Web Access Monitoring

### End to End Outlook Web Access Monitoring with the Techout Virtual Web Monitoring Appliance:

- Is it difficult for you to validate your Outlook Web Access (OWA) services are functioning and routing mail?
- Do your end user's complain of slow OWA response time?
- Can you measure how quickly mail flows to and from your OWA system to external email domains?

The Techout Virtual Web Monitoring Appliance is a pre-built, pre-configured, secure intranet based web monitoring solution which seamlessly integrates into your organizations strategic virtual infrastructure.

Our OWA web monitoring solution penetrates deep within your email framework. Our solution generates emails and validates their delivery to and from your OWA systems. Not only do we monitor the availability and response time of your OWA interface, we ensure mail delivery is achieved to and from your OWA system.

The Techout Virtual Web Monitoring Appliance ships with our patent pending Variable Simultaneous Angulation (VSA) technology. With VSA you can simultaneously monitor the availability and response time of your OWA services from multiple geographic locations within your secure intranet. This improves accuracy, reduces false alarms, and empowers you to gain valuable insight from remote locations. The solution is also available for intranet facing OWA systems.
