

Variable Simultaneous Angulation (VSA) - Unparalleled Accuracy

VSA - Our Patent Pending Simultaneous Methodology

The core of the Techout approach is our embedded Variable Simultaneous Angulation (VSA). VSA represents the act of simultaneously probing a web site, business transaction or SOAP Web Service from three or more locations.

For internet based applications, VSA is normally configured to probe from three different continents. Internal or Intranet based applications can be monitored from three locations of the customer's choice.

The embedded VSA technology empowers you to eliminate annoying false alarms while improving the accuracy in detecting and identifying real problems.

VSA offers the industry's first cluster member failure detection, which is one of the most difficult types of failures to detect because it is often masked as an intermittent problem.
